FREE-SAILING DETAIL

For true sailing, rubber tiller arm is held first 1/8 inch as shown. It runs thru to be held and held that is made in deck. Metal frame is attached to permit side-to-side movement. This is done by attaching a wire and giving rubber band between blocks. To do rubber band tends to hold sail and run in straight neutral position. The line (Washburn) goes to hook on tiller arm as a sail and rubber in neutral position. In sailing, when wind blows Washburn to one rubber moves to same side which neutral the turning tendency. This keeps boat in an approximate straight line course.
